

Heno Geo KJ800

Heno Geo KJ800 is a biodegradable geotextile commonly used for underwater protection of natural banks. The function of the fabric (soil retention) is taken over by vegetation over time.

Biodegradable geotextiles are not suitable for structures where high strength, long life, specific water permeability or sand density and combinations of these aspects are required.

- ❖ Free from rot and mould.
- ❖ Resistant to natural substances found in the soil.

Material: coir / jute (partly biodegradable)
Weight: 800 gr/m²

Length: 25 meter
Width: 200 cm

* Other dimensions available on request.
