

Heno Geo J400

Heno Geo J400 is a biodegradable Geotextile and is used to protect embankments, slopes and other surfaces against erosion from wind and (rain) water. It is often used in new planting.

The plants can easily be planted after laying the Heno Geo J400 in the substrate by cutting a cross in the Geotextile. It is also possible to sow (grass) seeds directly in the Geotextile. The vegetation eventually takes over the function of the Geotextile.

Features and Benefits:

- ❖ Prevents erosion and leaching;
- ❖ Protect the plant against frost and low temperatures;
- ❖ Protect against dehydration because evaporation is inhibited;
- ❖ Prevent the explosive growth of weed in the start-up phase.

Material: Jute (biodegradable)
Weight: 400 gr/m²

Length: 50 meter
Width: 200 cm

* Other dimensions available on request
